| Estimated Investment    | Rs. 120 crore                                                                       |
| Implementation Timeline | 24 months                                                                           |
| Target Visitor Capacity | Approximately 1,000 visitors/day at peak planned capacity (PoC planning assumption) |
| Document Status         | PoC input data — fictional / non-official                                           |

*This document does not represent, reference, or imply approval by the Madhya Pradesh Tourism Department, any government authority, or any real project. All names, locations, figures and capacity assumptions are illustrative constructs created to exercise the Sangam decision-support software. No real wildlife statistics, official clearances, or government project identifiers are used.*

## 1. Project Overview

The Madhya Pradesh Sustainable Nature Tourism Circuit (the "Project") is a fictional demonstration scenario representing a proposed nature-based tourism destination in Central Madhya Pradesh. The scenario has been constructed to provide realistic, structured input data for testing the Sangam Proof-of-Concept (PoC) software, which evaluates tourism development layouts against ecological, resource, safety, cost, and sustainability criteria.

| Attribute                      | Detail                                                                                                                                                                         |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Project Name</b>            | Madhya Pradesh Sustainable Nature Tourism Circuit — Demonstration Project                                                                                                      |
| <b>Project Objective</b>       | Develop a nature-based tourism destination that increases local economic opportunities while maintaining ecological compatibility, visitor safety and sustainable resource use |
| <b>Estimated Investment</b>    | Rs. 120 crore                                                                                                                                                                  |
| <b>Implementation Timeline</b> | 24 months                                                                                                                                                                      |
| <b>Target Visitor Capacity</b> | Approximately 1,000 visitors/day at peak planned capacity — a PoC planning assumption, not a tourism department forecast                                                       |

## Proposed Development Components

- Visitor facilities
- Controlled access routes
- Interpretation / information facilities
- Small-scale accommodation
- Parking
- Visitor movement infrastructure
- Water and sanitation infrastructure

## DEMONSTRATION PROJECT — PoC INPUT DATA — NOT AN OFFICIAL PROJECT DOCUMENT

## 2. Environmental Context

The proposed tourism area is located near environmentally sensitive landscapes. The planning considerations below are provided as simplified, illustrative inputs for the Sangam PoC and are explicitly labelled as PoC environmental planning assumptions — they do not represent verified field survey data, official biodiversity records, or wildlife population statistics.

| Planning Consideration        | PoC Environmental Planning Assumption                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------|
| <b>Ecological Sensitivity</b> | Portions of the proposed area are treated as ecologically sensitive for PoC modelling purposes |
| <b>Habitat Areas</b>          | Habitat areas are assumed to be present within or adjacent to the proposed site                |
| <b>Vegetation</b>             | Vegetation cover is assumed across parts of the site, relevant to footprint planning           |

| Planning Consideration   | PoC Environmental Planning Assumption                                                                 |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| Water Resources          | Local water resources are assumed to be present and relevant to sanitation and supply planning        |
| Visitor Pressure         | Visitor pressure is modelled as a function of assumed peak-day capacity                               |
| Human Activity           | Construction and operational human activity is assumed within and around the site                     |
| Waste Generation         | Waste generation is assumed to scale with visitor numbers and facility footprint                      |
| Infrastructure Footprint | Physical footprint of visitor facilities, access routes, and utilities is assumed as a planning input |

**Note:** All entries above are simplified planning-level placeholders labelled explicitly as "PoC environmental planning assumptions." No fabricated official statistics (e.g., species counts, protected-area designations) are included.

### 3. Tourism Objectives

| # | Objective                             |
|---|---------------------------------------|
| 1 | Generate local economic opportunities |
| 2 | Improve tourism infrastructure        |
| 3 | Improve visitor safety                |
| 4 | Reduce unmanaged visitor pressure     |
| 5 | Maintain ecological compatibility     |
| 6 | Support long-term sustainable tourism |

### 4. Resource Requirements

Delivery and operation of the proposed tourism circuit require the following categories of resource and infrastructure support. Each is a factor in comparing alternative layouts.

| Resource Category     | Relevance to Project                                                            |
|-----------------------|---------------------------------------------------------------------------------|
| Water                 | Required for visitor facilities, sanitation, and small-scale accommodation      |
| Electricity           | Required for visitor facilities, lighting, and site operations                  |
| Waste Management      | Required to manage waste generated by visitors and facility operations          |
| Sanitation            | Required for visitor and staff facilities across the site                       |
| Access Infrastructure | Required for controlled visitor movement, parking, and connectivity to the site |

### 5. Project Constraints

| Constraint               | Description                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------|
| Ecological Sensitivity   | Presence of ecologically sensitive landscapes near the proposed site                    |
| Visitor Capacity         | Target peak capacity of approximately 1,000 visitors/day must be accommodated           |
| Resource Availability    | Water, electricity, and waste management capacity must be sufficient for planned use    |
| Development Footprint    | Physical footprint of facilities and access routes must remain within acceptable limits |
| Construction Cost        | Estimated investment is capped at Rs. 120 crore                                         |
| Visitor Safety           | Layout must minimise risk to visitors across access routes and facilities               |
| Long-Term Sustainability | Selected layout should be sustainable to operate and maintain over time                 |

## 6. Alternative Development Layout Requirement

The initial proposal identifies one preferred tourism development site. However, the project plan explicitly requires that, if the proposed site produces unacceptable ecological or resource pressure, alternative site layouts, access configurations, or facility footprints must also be evaluated. The Sangam PoC is expected to generate and compare the following layouts:

| Layout                                | Primary Optimisation Focus                                                             |
|---------------------------------------|----------------------------------------------------------------------------------------|
| <b>Proposed Tourism Layout</b>        | Baseline layout currently identified as the preferred development site                 |
| <b>Ecology-Optimised Layout</b>       | Minimises ecological disruption and habitat pressure, subject to feasibility           |
| <b>Balanced Tourism Layout</b>        | Seeks an even trade-off across economic, ecological, safety, and resource factors      |
| <b>Resource/Cost-Optimised Layout</b> | Minimises resource demand and construction cost while meeting core safety requirements |

Each layout should be assessed against the same criteria set: economic opportunity, ecological/resource impact, visitor safety, capital and operating cost, and long-term sustainability.

## 7. Evaluation Criteria Summary

| Criterion                          | Indicative Evaluation Focus                                                          |
|------------------------------------|--------------------------------------------------------------------------------------|
| <b>Economic Opportunity</b>        | Does the layout generate meaningful local economic opportunity?                      |
| <b>Ecology / Resource Pressure</b> | Extent of habitat and vegetation impact, and pressure on local water resources       |
| <b>Visitor Safety</b>              | Safety implications of access routes, facility siting, and visitor movement          |
| <b>Cost</b>                        | Capital cost relative to the Rs. 120 crore budget ceiling and ongoing operating cost |
| <b>Sustainability</b>              | Overall long-term balance between economic, ecological, and safety outcomes          |

## 8. Project Planning Question

***“How can tourism infrastructure and economic growth be developed while maintaining ecological compatibility, visitor safety and sustainable resource use?”***

This question defines the core decision-support task for the Sangam PoC: to test whether the software can process the structured inputs above and produce a comparative evaluation of the Proposed Tourism Layout against the Ecology-Optimised, Balanced, and Resource/Cost-Optimised alternatives.

## 9. Document Status and Disclaimer

**This entire document is a FICTIONAL DEMONSTRATION created solely to provide structured input data for testing the Sangam Proof-of-Concept (PoC) software. It does not describe an actual, planned, or approved government tourism project. No real project names, government logos, official seals, wildlife population statistics, official project numbers, or claims of government approval are included or implied. Any resemblance to an actual project is coincidental and unintended. All figures (investment, timeline, visitor capacity) are illustrative placeholder values chosen for PoC testing convenience.**
